

Recomendations

Definition

No problems were found, but it is also recommended to detail the program a little more.

Requirements

Better declare the requirements so that they have better affinity with the diagrams.

Use case

Modify the classes to match the requirements.

Class diagram

Improve the syntax and be careful with classes added without being mentioned in the previous docs.

Data files

Missing Json files, it is recommended to create them and have some functionality.

Execution

The validations are not implemented, I recommend using and improving the class that includes the validations and implementing them in the code, so that the system does not collapse later.

It should also be noted that the menu in some situations was in English.

Clean Code

Improve the declaration of variables, methods and classes since a large percentage of it is in the plural, they are abbreviated and in some cases there are unnecessary comments.

The printing is mixed in English and Spanish, it is recommended to change.
